

Removes 80 - 85 times more bacteria from surfaces

With growing concerns about MRSA, norovirus, and other deadly infections, it's good to know a system has been developed that has been tested and proven to clean surfaces and remove these harmful biopollutants. The all-new, patent-pending KaiFly, developed by Kaivac - the No-Touch Cleaning experts - cleans countertops, walls and partitions effectively - and it's said to remove 80 to 85 times more bacteria than conventional 'wipe' methods. Combining microfibre, a window squeegee, and a motorised sprayer, the KaiFly is ideal for protecting human health - and it does it in half the time.

"We're on a mission to eliminate the world's toughest cleaning problems with breakthrough products and methods," says the company. "By putting ourselves in the workers' shoes, we develop a unique understanding of building maintenance problems that allows us to engineer innovative, worker-friendly solutions to make workers' jobs safer, faster, and more satisfying. Kaivac does for the custodian what the bulldozer does for the ditch digger - moves more dirt, in less time, with pride."
