

Extractor Becomes a “Reel” Eye-Catcher

When U.S. Products recently introduced the King Cobra 500 one of the features that caught everyone’s eye was sitting right on top—a built-in, all-new, hose reel-management system.

The reel-management system, which includes the vacuum and solution hose, helps improve organization, productivity, and professionalism.

Users can unwind as much hose as necessary for the task at hand, and the entire unit can be removed for easy transport.

Admirers soon rediscovered another feature on this machine—one that U.S. Products has long been famous for—heat. The King Cobra has a solid-state heat-management system that provides instant and constant heat to 212° F at the wand tip. Heat has been proved to improve the effectiveness of cleaning chemicals and helps clean carpet faster and more thoroughly.

Along with the hose reel-management system and heat, the King Cobra has a host of other features as well, including:

- Variable 500 psi, 300 psi, 300/75 psi, and 150 psi pressure allows it to perform well on delicate fabrics, upholstery, as well as the dirtiest carpets.
- A Smart Circuit Locator automatically detects separate power lines to help eliminate blown circuits.
- Sixteen-gallon tank capacity allows for longer run times, which helps reduce labor costs.

On the back of the King Cobra are even more features, including a wand holder, chemical tray, and oversized rear wheels. The large wheels make for easy transport and trouble-free stair climbing. Also, the solution fill access is conveniently located to reduce lifting, and a large drain hose allows complete recovery tank draining.
